

This is a sample pdf file to test my project, 9566779891 – this is the first phone number in the file.

2335453 – This is random number which is not of 10 digits thus is not a number, 9570099779 – this is the second phone number in the file. Let's throw a email address – arpitfalcon1@gmail.com . Email address second can be included here – decode792000@gmail.com. I guess extracting email addresses may be a problem considering their variety and variable sizes too. We can now throw a phone number – 9876543210 and one more email address of my friend to make him happy – samarat3154@gmail.com. Also alphabet@outlook.com so that gmail doesn't feel so superior.
